This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99999, ABF00010-ABF99999, ABH00010-ABH99999 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but fire.wipo.int/pub/published_pct_sequences
                                                                    Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                 Claim 1; SEQ ID NO 143692; 29pp + Sequence Listing; German

                                                                                                                                                                                                                                                                                                                                                            olek A,
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, asrdowascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF9989, ABH00010-ABF9989, ABH00010-ABF9989, ABH00010-ABF9989, and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form mat of the printed specification, but was obtained in electronic format from WIPO at.

The sequences given in AAQ61990-2001 are oligonucleotides which contain G4 or G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV), activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyper-proliferation, malignancy, cardiovascular disease and snake bite. Oligonucleotides such as these, may be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
              w modified oligo-nucleotide contg guanine quartet - inhibits activity
viruses, e.g. HIV, and phospholipase A2 and modulates telomere length
chromosomes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAQ61915,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                      The sequences given in AAQ42793-802 are oligomers which contain pseudonucleotides which contain anthraquinone. These oligomers were tested for stability in vitro and in vivo, and specificity of hybridisation to complementary DNA and RNA. Hybridisation was increased with respect to DNA and RNA complement in almost all cases. The oligomers which contain two anthraquinone modifications generally show cumulatively enhanced stability as compared to those with only one such residue. These oligomers are useful for therapeutic, esp. antisense therapy, diagnostic
                                                                                                                                                                                          Modified oligo:nucleotide(s) conjugates to anthraquinone - useful as anti-sense agents for treating and diagnosing diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inhibition; replication; herpes simplex virus; HSV; HIV; retard; human cytcomegalovirus; influenza virus; inflammation; telomere length; neurological disorders; phospholipase A2 activity; hyperproliferation; malignancy; cardiovascular disease; snake bite; malignancy; aging; ss.

ö
The sequences given in AAQ61913-16 are oligonuclectides which contain a def stretch and which may be used for inhibiting replication of human immunodeficiency virus (HIV) Oligonucleotides such as these may also be used for inhibiting activity of HSV, human cyromegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyper-proliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-WAR-2003 to correct FN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAQ61825-50 and AAQ61886-906 are oligonucleotides which contain a G4 or two G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV). Oligonucleotides such as these may also be used for inhibiting activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of

They are used especially for the treatment of the immunosuppressive effect of TGF-beta, augmentation of the proliferation of cytotoxic lymphocytes, treatment of endogenous hyperexpression of TGF-beta, treatment of breast tumours, neurofibromas and mallipant glindma, including glioblastomas, treatment and prophylaxis of skin carcinogenesis, and treatment of oesophageal and gastric carcinomas. See AAQ78352-078468. The sequences given in GENESEQ files AAQ78352-078468 are antisense oligodeoxynucleotides of TGF-beta 2 in the form of phosphorothioate
                                                                                                                                                                                                                                                                                                                                                                                                                                      Transforming growth factor beta; TGF-beta; antisense; treatment; tumour; angiogenesis; breast tumour; neurofibroma; glioma; glioblastoma; carcinogenesis; carcinoma; oesophagus; oesophageal; gastric; gut; immunosuppression; oligonucleotide; ss.

                                                                                                                                     d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide nucleic acid (PNA) oligomers are provided which (a) consist of naturally occurring nucleobases covalently bound to a polyamide backbone and (b) hybridise to the translation initiation ANG region, 5' untranslated region (3' UTR), splice junctions or coding sequence of a human immunodeficiency virus gene chosen from env. gag, pol, rev and tat. The PNAs can be used to target chosen from env. gag, pol, rev and tat. The PNAs can be used to target radiation moieties. They have utility as gene-targetted drugs for regulation moieties. They have utility as gene-targetted drugs for regulation moieties. They have also useful in diagnostic applications and as research tools. PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with RNA or seDNA and a second PNA strand binds with the resulting double helix or with the first PNA strand. The PNAs possess no significant charge and are water soluble, which facilitates cellular uptake. Further, since they contain amides of non-biological amino acide, they are biostable and resistant to enzymatic degradation by proteases. The present sequence is a specifically claimed PNA sequence (represented by the sequence of nucleobases) targetting HIV genes. (Updated on 25-MAR-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a conjugate of an oligonucleotide and a rigid polycyclic molecule, preferably an amino-substituted steroid. The conjugate can be used for diagnostic purposes by detecting a nucleic acid sequence. It forms a more stable complex with complementary DNA sequences than the unconjugated oligonucleotide alone. The present sequence is an example of an oligonucleotide used to demonstrate the invention. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   steroid; conjugate; oligonucleotide; diagnostic; hybridisation probe; ss

Oligonucleotide complementary to test sequence

(first entry)

13-MAR-1997

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beta 3 pene, an integrin alpha 6 subunit gene, or a Tie-2 gene AAA1755 to AAA17167 and AAA17560 and AAA1762 represent ribozyme sequences for ARNT, and AAA19154 represent trbozyme sequences; AAA16785 to AAA184154 represent ribozyme sequences; AAA191763 to AAA19154 represent ribozyme sequences; AAA1968 to AAA19169 to AAA19155 to AAA19155 to AAA19159 represent ribozyme sequences; AAA19154 represent ribozyme sequences; AAA19155 to AAA21968 represent their corresponding target sequences; AAA1922 represent their corresponding target sequences; AAA19251 to AAA2156 and AAA21501 to AAA21595 represent ribozyme sequences; AAA2185 to AAA2156 and AAA21501 to AAA21595 represent ribozyme sequences; and AAA2186 and AAA22476 to AAA21560 and AAA21500 and AAA2185 to AAA21500 and AAA21505 to AAA21500 and AAA2185 to A integrin subunit alpha-6, or integrin subunit beta-3

Oligo-nucleotide conjugates with poly:cyclic mols., esp. steroid(s) useful as nucleic acid hybridisation probes.

The invention relates to a conjugate of an oligonucleotide and a rigid polycyclic molecule, preferably an amino-substituted steroid. The conjugate can be used for diagnostic purposes by detecting a nucleic acid sequence. It forms a more stable complex with complementary DNA sequences than the unconjugated oligonucleotide alone. The present sequence is one tased in the examples to test the hybridisation efficiency of a complementary oligonucleotide sequence (AAQ67549) conjugated to an aminosteroid. The present invention describes oligonucleotides (I) of 10-15 residues corresponding to a part of a vascular endothelial growth factor (VEGF) comprising 1 of 6 sequences given in AAA06692 to AAA06697. AAA06699 to AAA0673 represent VEGF antisense oligonucleotides used in the exemplification of the present invention. The antisense oligonucleotides can contain phosphorothioate linkages. Oligonucleotides from the present invention have cytostatic and anaglogenic activities, and can be used in gene therapy. The oligonucleotides are useful for inhibiting the expression of VEGF, e.g. for the treatment of diseases associated with andhormal vascular permeability, cell proliferation, cell permeation, angiogenesis, necovascularisation, tumour cell growth and/or metastasis. AAA06784 represents a human VEGF nucleotide sequence from which the Disclosure, Page 3, 73pp, English.

Composition for modulating transcription or replication of a pre-selected target sequence and for treating a plant or animal disease, comprises a recombinase and two probes, each containing a homology clamp and an

```
The present invention relates to a composition comprising a recombinase and two complementary single stranded probes each containing at least one homology clamp corresponding or complementary to a preselected target nucleic acid sequence and at least one anchoring sequence. The present nucleic acquence is a heterologous insert sequence used to generate the probes that can be used in the present invention. The composition of the present invention can be used in the present transcription or replication of a present clarget sequence, treat a disease state of a plant or animal caused by expression of a disease gene, detect a double stranded nucleic acid target sequence, isolate either strand of a gene family, produce a transpenic non-human organism or plant, determine the function of a couble stranded nucleic acid target sequence and inhibit double stranded nucleic acid rotation or branch migration. In addition, the composition may be used to produce animal models for genetic defects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

New chemically modified oligonucleotides, useful for modulating telomere length of a mammalian chromosome, inhibiting the division of a malignant mammalian cell, or modulating the effects of aging of a mammalian cell.

The invention relates to a novel chemically modified oligonucleotide having no more than about 27 nucleic acid base units. The oligonucleotide modulates mammalian telomere length. The chemically modified oligonucleotide of the invention may be useful for modulating the

New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and related disorders

Claim 11; SEQ ID NO 175; 159pp; English

The invention relates to an isolated nucleic acid (NI) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADEI3890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter, opromoter, a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing or promoter operably linked to a heterologous sequence, diagnosing or promoter operably linked to a heterologous sequence, diagnosing or promoter operably linked to a heterologous sequence, diagnosing or promotering allowed to a new percent and a sample containing on the presence of an optineurin promoter sequence variation in a sample containing DNA, detecting the presence of an optineurin promoter sequence variation in a sample containing DNA, determining the presence or increased succeptibility to glaucoma or to a progressive ocular hypertensive disorder resulting in loss of visual field in a patient (or the severity or progression of glaucoma in a patient, comprising providing

The specification describes the detection of a mutation in a gene causing human Werner's syndrome. The method comprises amplifying a DNA fragment containing a mutation at position 733, 734, 1620 or 4146 of AAV65701 or at position 42 of AAV65702 and synthesising an oligonucleotide so that the base at the above site comes to be the 3' end based on the base sequence of AAV65701-02, or an oligonucleotide in which the base adjacent to the 3' end comes to be the 5' end. The oligonucleotides are hybridised with the resultant amplified fragment. The method can be used to diagnose Werner's syndrome
amplification reaction primers that direct amplification of a selected nucleic acid region containing the variation within the optineurin promoter and amplifying the DNA) and detecting a polymorphism (comprising obtaining a sample containing human genomic DNA, providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and detecting the polymorphism). The invention is used to diagnose and prognose glaucoma and also to treat glaucoma related disorders. The present sequence is an optineurin promoter motif, repeat element or putative regulatory region.
                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             - and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Lin KY,
RESULT 1054
AAQ42793/c
                                                                                               This sequence is an immunosuppressant inhibitor oligonucleotide, which is used in the invention. The invention relates to a composition which used in the invention. The invention relates to a composition which contains at least one inhibitor (less than 100 kD) of a substance (e.g. transforming growth factor TGF-Deta, vascular endothelial growth factor VEGF, interleukin-10 IL-10, prostaglandin E2 FGE2, or their receptors) that adversely affects the immune response. The composition also includes at least one stimulant that positively affects the immune response. This cligonuclectide is an example of an inhibitor that is used in the treatment of neoplasms and infections, particularly hyperproliferation; composition. The composition is used in immunostimulant for the treatment of neoplasms and infections, particularly hyperproliferation; colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus, breast, ovary, cervix, endometrium, prostate or bladder) liver tumours, colon-rectum, brain tumours and sarcomass. The oligonuclectides, most of which are directed against TGFbeta or VEGF, are inhibitors of monocyte chemotactic protein-1 (MCP-1) and are useful as anti-infinatories for treating e.g. asthms, Crohn's disease, ulcerative colitis, diabetes, glomerulonephritis, acute respiratory distress syndrome and the formation of atherosclerotic plaque
                                                                                                                                                                                                                                                                                                 Immunosuppressant inhibitor; transforming growth factor beta, TGF beta, vascular endothelial growth factor; VEGF; interleukin-10; IL-10; cancer; prostealandin E2; pGE2; immune response, tumour; asthma, orohn's disease; monocyte chemotactic protein-1; MCP-1; ulcerative collitis; diabetes; glomerulonephritis; acute respiratory distress syndrome; ss;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition containing immune stimulant and inhibitor of agent tadversely affects the immune response, for treating cancers and infections.
                                                                                                                                                                                                                                                  Immunosuppressant inhibitor oligonculectide TGF-beta2-15/1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Brysch W;

Location/Qualifiers

The sequences given in AAQ42793-802 are oligomers which contain pseudonucleotides which contain anthraquinone. These oligomers were tested for stability in vitro and in vivo, and specificity of hybridisation to complementary DNA and RNA. Hybridisation was increased with respect to DNA and RNA complement in almost all cases. The oligomers which contain two anthraquinone modifications generally show cumulatively enhanced stability as compared to those with only one such residue. These oligomers are useful for therapeutic, esp. antisense therapy, diagnostic and research applications Gaps Oligomer; specificity; pseudonucleotide, anthraquinone, in vitro; in vivo; hybridisation; antisense therapy; stability; diagnosis; ss. .; 0 0.5%; Score 11.4; DB 1; Length 15; 92.3%; Pred. ```
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential communosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Stinchcomb DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW; Grimm S, Karpelsky A, Kisich K, Marulic-Adamic J, Mcswiggen JA; Modak A, Pavco P, Palcjeman L, Sullivan SM, Sweedler D, Thompson JD; Tracz D, Usman N, Wincott FE, Woolf T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ribozymes having modified bases and methods for producing them - for use in inhibiting disease related genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in AAQ42793-802 are oligomers which contain pseudonuclectides which contain anthraquinone. These oligomers were tested for stability in vitro and in vivo, and specificity of hybridisation to complementary DNA and RNA. Hybridisation was increased with respect to DNA and RNA. Hybridisation was increased with respect to DNA and RNA complement in almost all cases. The oligomers which contain two anthraquinone modifications generally show cumulatively enhanced stability as compared to those with only one such residue. These oligomers are useful for therapeutic, esp. antisense therapy, diagnostic and research applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modified oligo:nucleotide(s) conjugates to anthraquinone - useful as anti-sense agents for treating and diagnosing diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enzymatic nucleic acid; ribozyme; trans cleavage; inhibition; dewregeulation; interieukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TWF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; Translocation; ofronic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atherosclerosis; myocardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriasals; myocardial ischaemia; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome; AlDS;

A claimed enzymatic RNA mol. for the cleavage of apolipoprotein (a) (apo(a)) mRNA, specifically a hammerhead ribozyme, has binding arms complementary to the present sequence (nucleotide position 1294). The ribozyme blocks to some extent apo(a) expression, and can therefore be used to diagnose or treat conditions related to lipoprotein (a) levels, e.g. atherosclerosis, myocardial infarction, stroke, restenosis and heart disease. PCR was used to generate a substrate for 17 RNA polymerase transcription from human apo(a) cDNA clones. Labelled transcripts were synthesised in vitro to form 2 templates. The oligonucleotides and incubated. After a designated time the reactions were stopped, and RNA sept. on sequencing polyacrylamide gels. The percentage of substrate cleaved was determined by autoradiographic quantification, and the most
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA.
Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enzymatic RNA mols. which cleave apo(a) mRNA - useful in diagnosis and treatment of conditions related to Lp(a) levels, e.g. atherosclerosis, myocardial infarction, and heart diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Apo(a) mRNA (nt. pos. 12974) hammerhead ribozyme target sequence.

The ribozyme blocks to some extent apo(a) expression, and can therefore be used to diagnose or treat conditions related to lipoprotein (a) levels, e.g. atherosclerosis, myocardial infarction, stroke, restenosis and heart disease. PCR was used to generate a substrate for T7 RNA polymerase transcription from human apo(a) cDNA clones. Labelled transcripts were labelled transcripts were annealed, RNaseH added and the mixts. Incubated. After a designated time the reactions were stopped, and RNA sept. on sequencing polypacrylamide gals. The percentage of substrate cleaved was determined by autoradiographic quantification, and the most accessible ribozyme target sites chosen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enzymatic RNA mols. which cleave apo(a) mRNA - useful in diagnosis and treatment of conditions related to Lp(a) levels, e.g. atherosclerosis, myocardial infarction, and heart diseases.

The present invention describes a novel enzymatic nucleic acid (ENA)
having a hammerhead motif (HM) comprising: (i) at least 5 ribbse residues
(ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
membrane of joints for the treatment or prevention of arthritis,
can inhibit collagenase and stromelysin production in the synovial
membrane of joints for the treatment or prevention of arthritis,
particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
be used to treat antigen presenting cells of a donor to induce tolerance
in a recipient to an alloantigen of a donor. They can also be used for
chancing graft tolerance or for treating autoimmume disease, and for
treating allergies and other inflammatory conditions. The ENA's can also
be used in diagnosis Ribozyme therapy impacts on the expression of
stromelysin without introducing the non-specific effects upon gene
expression which accompany treatment with retinoids and dexamethasone.
The concentration of ribozyme required to affect a therapeutic treatment
is lower than that required of antisense molecules, and is highly
concentrating of ribozyme required to affect a therapeutic treatment

AATS0138-T50359 represent target sequences for the rabbit cholesterol cester transfer protein (CETP) hammerhead (HH) ribozymes (see AATS0360-CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The ribozyme are able to cleave mRNA from the gene encoding CETP, thereby blocking cynthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or eliminated) thereby preventing the reduction in size density of the high density conclusions (HDL), prolonging HDL half life, and therefore increasing the levels. The ribozymes can be used to treat conditions associated with abnorable of CETP, specifically atherosclerosis, familial chypercholesterolaemia, peripheral vascular disease, dyslipidaemia, hypoalphalipoproteinaemia, vascular complications of diabetes, transplant, acherecomy and angioplastic complications of diabetes, transplant, archerecomy and angioplastic crestenosis. By inhibiting CETP, the levels of HDL and low density complications (LDL), and the HDL:LDL ratio are favourably altered (a lipoproteins (LDL), and a corresponding increase in HDL levels. The CHT Prozymes can also be used diagnostically to study genetic drift and materions in diseased cells, and coffect CETP mRNA. As the HH ribozymes can also be used diagnostically the study genetic drift and coff target specific regions of the CETP gene, they have low non-specific

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Specifically designed oligodeoxyribonucleotides form triplexes in single-
or double-strand DNA at homopurine-homopyrimidine targets. These
triplexes block in vitro NRA synthesis by all DNA polymerases studied,
including Sequenases, Taq, Went, and Pol I. A similar phenomenon occurs
when DNA polymerases are supplemented with accessory replication
proteins, including SSB protein. Replication blockage is highly sequence-
specific and even one or two point substitutions within either the target
sequence or the oligonucleotide abolish the effect. Sequence-specific
blocking of DNA replication in vivo is facilitated by the methods and
compositions of the present invention. The present sequence is a triplex-
forming oligonucleotide which targets ORP-Ec of human papilloma virus
(position 436-452 in HPV57 and 438-452 in HPV2)

PCR primers AAV43307-08 were used to amplify nucleic acid ligands of ICP4, which were isolated using the SELEX (Systematic Evolution of Ligands by Exponential enrichment, procedure. ICP4 is the major transcriptional regulator of Herpes simplex virus (HSV) gene expression. The specification describes a method for the identification of nucleic acid ligands to an ICP4 protein family member (PRM), which uses the SELEX procedure. The method is used to yield a mixture of nucleic acids enriched for nucleic acid sequences with relatively higher affinity and specificity for binding ICP4 protein family member. The nucleic acid are ligands indentified are used in the treatment or prevention of diseases or medical conditions in humans, specifically those caused by herpes viruses. They may also be used in diagnostic procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identification of nucleic acid ligands to ICP4 protein family member comprises preparing candidate mixture of nucleic acids, contacting candidate mixture of nucleic acids with ICP4, partitioning increased affinity nucleic acids, and amplifying.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or etablility of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the finalike tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foctal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                            Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; VEGF, hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                        AAV48709-886 represent antisense oligonucleotides directed against the ExbB-2 gene. Of these, only oligonucleotides AAV48709-91 resulted in Significant reddution in ExbB-2 protein expression, while oligonucleotides AAV48792-886 had little effect. The oligonucleotides exemplify the invention. The specification describes oligonucleotides that that contain 8-30 nucleotides, which contain at most B nucleotides that consecutive nucleotides able to form three H-bonds each to four consecutive rucleotides able to form three H-bonds each to four consecutive cytosines, and the ratio between residues able to form two H-bonds each to three such bonds (3R) is given by 2R/3R = 0.33-0.72. The cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The cytosines for p53, ErB-2, junB, junD, TGP-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The coligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                   Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapputically or to modulate grown of cells in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transcript tag sequence increased in pancreatic and colorectal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tag sequence; colorectal cancer; pancreatic cancer; colon cancer; diagnosis; prognosis; treatment; ss.

Use of isolated gene transcripts - useful for developing products for the diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer.

Disclosure; Page 79; 120pp; English.

differentially expresent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic cand the second sample is a normal human colonic tissue. The transcript is identified by a tag a normal human colonic tissue methods of the invention can be used in the diagnosis, prognosis and

Producing specific polynucleotides using rolling templates.

Example 5; Page 38; 109pp; English.

The invention relates to a method for producing polynucleotides having a defined sequence using rolling templates that successively add nucleotides (nts) to a longer primer strand. The method comprises: (i) incubating, under annealing conditions, a primer and a template that has

ö

the 3'-region not complementary to the primer, a 3'-region complementary to the 3'-red of primer and a non-reactive 3'-remninus, with the template being shorter than the primer; (ii) reacting the primer with at least one in in presence of a template-dependent polymorlectide polymerase to extend it by at least one in (complementary to the 5'-region of template) at its 3'-end; (iii) separating the template and the extended primer; and it is 3'-end; (iii) separating the template and the extended primer; and the desired polymorlectide. The method is especially used to synthesize the desired polymorlectide. The method provides fast, accurate, inexpensive synthesis of RNA or DNA and is more efficient than chemical coupling processes. It has higher specificity and eliminates the need for deprotection. The products can be cloned directly. The method avoids problems of waste disposal and includes an inherent editing effect (failure sequences will not be extended further in subsequent rounds) so that purification of the end product is facilitated. Synthesis may take place on a vector, simplifying cloning and sequences with codon usage coptimized for a particular host can be prepared

Species-specific detection of a Trichosporon genus microbe species and a new polynucleotide - used for the diagnosis and the treatment of Trichosporosis.

Disclosure; Page 44; 47pp; Japanese.

The present invention describes a method for the species-specific detection of a Trichosporon genus microbe which includes detecting a polynucleotide specific to the species of a Trichosporon genus microbe. Trichosporon polynucleotides can be used for the diagnosis and treatment of Trichosporonsis. The method can distinguish Trichosporosis species to species level rapidly in high precision. AAA2674 to AAA26849 represent polynucleotide sequences from various Trichosporon species, which are used in the exemplification of the present invention

Campylobacter coli and C. jejuni are causative species of acute diarrhoeal disease in humans. The present invention relates to detection of these bacteria, in humans, by using nucleic acid primers in Strand Displacement Reactions (SDA). These primers are specific for the C. coli and C. jejuni superoxide dismutase (sodB) gene. The present sequence is one such primer, BR42. BR42 is a downstream bumper primer for C. jejuni and C. coli sodB. The primers may be used after culture as means for confirming the identity of the cultured organism, and with clinical samples from humans or animals, e.g. faecal material or with samples of contaminated food or water, for the detection and identification of C.                                                                                                                                                                                                                                                                                                           The present invention relates to an oligonucleotide array comprising oligonucleotide tags fixed to a solid substrate. The oligonucleotide array is useful for genotyping a nucleic acid sample at one or more loci via single base extension (SBE) reactions. A pair of primers is used to amplify a polymorphic locus in a sample e.g. a single nucleotide uspolymorphism (SNE). The present sequence is one of the primers used in the method of the present invention to amplify a polymorphic sample. The amplified nucleic acid product is then used as a template in a SBE reaction with an extension primer. The SBE reaction products are used to
                                                                                                                                                                                         Universal array of oligonucleotides tags attached to a solid substrate along with locus-specific tagged oligonucleotides useful in genotyping using single base extension reactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               involving the administration of an isolated immunostimulatory

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention is concerned with the elucidation of the gene cluster from Streptomyces globisporus which regulates enediyne C-1027 synthesis. Enediyne C-1027 is an antibiotic, consisting of an apoprotein and a non-peptidic chromophore, which causes damage to DNA. The primers AAA63353-A63451 were used to isolate the open reading frames which comprise the gene cluster. The sequences within the gene cluster can be used to produce the protein and to identify antagonists, both of which can be used in the treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oligonucleotide array, genotyping, single base extension reaction, SBE, PCR primer; polymorphic locus, single nucleotide polymorphism; ss.

present sequence may have a phosphorothioate backbone

Sequence 15 BP; 3 A; 2 C; 8 G; 2 T; 0 U; 0 Other;

```
The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
                 The present invention describes an improvement to a method requiring the administration of interferon alpha (IFN-alpha), involving administering an immunostimulatory nucleic acid (ISNA). The sequences of a number of such nucleic acids are also provided. These may comprise oligonucleotides with phosphorothioate backbones, palindromes, or G-rich sequences. The sequences of the invention are useful in the treatment of proliferative diseases, such as cancers, and viral infections. The present sequence is an example of an immunostimulatory oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vaccine; cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immnostimulatory; tumour; viral infection; bacterial infection; fungal infection; cancer; asthma; infection; parasitic infection; cancer; asthma; infectious disease; allergy; immune deficiency; phosphorothicate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diseases, allergies and asthma nucleic acids.

The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153 - F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, varts, benign growths, cancers of the skin, a hypermeovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can bused to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-745161). The method is useful for ameliorating the effects of psoriasis, inchthyosis, pityriasis, ruba, pitaris, serborrhoea, Keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovacular condition much as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                     Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein, IGFB-2; IGFBP3; inflammation, psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba, keratosis; neoplasia; scaleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia, kidney disease; neobactic of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

```

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insuln-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] -2 or IGFBP3, which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or orher disorders. The present esquence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153 oligonuclectides of the present invention (see AAF45151 and AAF45153 in thinyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hypericonsense in a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hypergroliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

```

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticense oligomucleotide, (for Insulin-like Growth Factor IGRF)—1 receptor, IGF binding protein [IGFSP]—2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation.

In inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide is useful for ameliorating the effects of psoriasis, rothyyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, chrowing disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia

```

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense objectide, (for Insulin-like Growth Factor [IGRF-1] creeptor, IGF binding protein [IGFBB-2] or IGFBB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, coligonucleotide which can be used to design the antisense oligonucleotides of the present interaction the antisense oligonucleotides of the present invention (see AAP45151 and AAP45153-CP F45161). The method is useful for ameliorating the effects of psoriasis, inthium of the present invention (see AAP45151 and AAP45153-CP F45161). The method is useful for ameliorating the effects of psoriasis, inchipation in the present invention and provide skin, a collabsias, scleroderma, warts, benign growths, cancers of the skin, a complasias, scleroderma, marts, benign growths, cancers of the skin, a companion of present inventediated malignancies, other sclerodic disease, kidney disease, hyperproliferation of the inside of blood collabsias or any other hyperplasia

Ameliorating the effects of a disorder, e.g. psoriasis, by administering V (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 7; Page 44; 201pp; English

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an entisense oligomuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, in inhibiting or reducing growth factor mediated cell proliferation, oligomuclectide which can be used to design the antisense oligomuclectides of the present invention (see AAF45151 and AAF45153 - F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, cohthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic vascals or any other hyperproliferation of the inside of blood vessels or any other hyperplasia

Wraight CJ,

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 8; Page 63; 201pp; English.

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticomplete of antisense oligonucleotide, (for Insulin-like Growth Factor IIGF)-1 creceptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, or inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide is useful for ameliorating the effects of psoriasis, coligonucleotide is useful for ameliorating the effects of psoriasis, colthyposis, pityriasis, ruba, pilaris, serborrhoea, keloids, kertosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperpector mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood covered to the series or any other hyperplasia

```

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleoride, (for Insulin-like Growth Factor [GP]-1 receptor, IGF binding protein [GFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders, the present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153- F45161). The method is useful for ameliorating the effects of psoriasis, inchipyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, disease, kidhey disease, hyperproliferation of the inside of blood vessels or any other hyperplasia

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an anticoperation (for Insulin-like Growth Factor [1679-] receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation.

Inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be useful for ameliorating the effects of psoriasis, cliphorals, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, besses, kidney disease, hyperproliferation of the inside of blood is easels or any other hyperplasia
                                                                                                                                                                                                                                                Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 15 BP; 1 A; 5 C; 8 G; 1 T; 0 U; 0 Other;

The present invention relates to a method for ameliorating the effects of artisense oligonucleotide, (for Invalin-like Growth Factor [IGF] receptor, IGF binding protein [IGFSP] -2 or IGFBP3), which is capable inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the artisense oligonucleotides of the present invention (see AAF$151 and AAF$153 - P45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, hyperproliferation of the inside of blood
                                                                                                                                                           Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV'(ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

```
skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [167]-1 receptor, 1GF binding protein [16FB9]-2 or IGFB9], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-154516). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplastas, soleroderma, warts, benigm growths, cancers of the skin, a hypernecvascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperplasia

Polymucleotides comprising one or more of twenty four novel single nucleotide polymorphisms in the TNRSF1B gene have been identified. TNRRSF1B regulate osteoclast recruitment and function. An understanding of variations in the gene should thus be useful in developing new therapies for metabolic disorders caused by abnormal osteoclast recruitment and function such as osteoporosis, metastatic bone disease, Paget's disease, rheumatoid arthritis and periodontal bone disease
skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serbornhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human Osteoclastogenesis Inhibitory Factor nucleotides, comprising single nucleotide polymorphisms, useful for studying e.g. osteoporosis, Paget's disease and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, TNFRSF11B; osteoclastogenesis inhibitory factor; single nucleotide polymorphism; SNP; osteoclast recruitment; osteoclast function; osteoporosis; metastatic bone disease; Paget's disease; rheumatoid arthritis; periodontal bone disease; ASO;
                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of the top strand of a double-stranded oligonuclectide probe corresponding to GRR of the FogR1 gene. The probe was used in electrophoretic mobility shift assay of HepG2 cells that had been transfected with recombinant variants of the human interleukin 10 receptor alpha subunit (II-10RA) and control. A single nuclectide polyamphism has been discovered in the II-10RA gene (see AAH27020), which causes the amino acid at position 31 to change from a Gly to an Arg. The invention provides variant human II-10RA polyapptides and nucleic acids encoding them. The variants have an amino acid substitution at position Gly31 and/or Ser159 or from position Leu62 of the standard II-10RA sequence (see AAB82983). They display at least 3-fold modified, are useful in preparing antibodies, agonists and antagonists useful for diagnosing or treating various II-10 or receptor-related medical conditions, e.g. cronn's disease, inflammatory bowel disease, ulcerative collitis, autoimmune conditions such as systemic lupus erythematosus and rheumatoid arthritis, septic and toxic shock, and infection
                                                                                                    ·

These organisms are the cause of acute diarrhoeal disease in humans, and their rapid identification enables the appropriate treatment to be determined. The probes and primers can be used to identify the organisms in cultured samples, clinical samples such as faecal material and food and water
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel oligonucleotide primers for amplification and detection of superoxide dismutase target sequences found in Campylobacter jejuni and Campylobacter coli.
                                                                                                                                                                                                                                                                                                                                                                 Organism identification; superoxide dismutase; sodB; acute diarrhoea;

                                                                                                                                                                                                                                                                                                                                                     The present invention relates to polymorphisms of the human interleukin 4 receptor-alpha gene (IL4R-alpha; see AAF5718 for the reference sequence). Polymucleotides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression of a particular IL4Ralpha protein isoform, an expression desirable to decrease or block expression of a particular IL4Ralpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRMA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a probe for human IL4R-alpha
                                                                                                                                                                                                                                                                                 New isolated polynucleotide useful for the identification of therapeutics in allergic diseases is new.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps

```

The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotronin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing a recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a genotyping oligonucleotide is used to detect a polymorphism in the SLC6A4

Sequence 15 BP; 1 A; 4 C; 3 G; 7 T; 0 U; 0 Other;

New isolated polynucleotide comprising a polymorphic variant for the solute carrier family 6 neurotransmitter transporter, serotonin member 'gene for identifying drugs for treating disorders related to expression of the protein.

Claim 12; Page 21; 152pp; English.

Screening for Alzheimer's disease in a mammal, by making two-dimensional array of a feature whose relative abundance correlates with disease, and comparing with abundance of the feature in samples of healthy persons.

Claim 84; Page 157; 162pp; English.

The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's Disease-Associated Features (AFS) and Alzheimer's Disease-Associated Features (AFS) and Alzheimer's Disease-Associated Protein Isoforms (AFIS) in cerebrospinal fluid, serum or plasma. The abundance of the AFS and APIS is then normalised to an Expression Reference Protein Isoform (ERPI) in order to determine whether a patient is suffering from, or has a predisposition to, Alzheimer's Disease. The relative abundance of the AFs and APIS correlates with the severity of Alzheimer's Disease. The present sequence is a probe that may be used for screening an API

(GENA-) GENAISSANCE PHARM INC

WPI; 2002-089915/12.

The invention relates to genetic variants of human G-protein coupled receptor 31 (GPR31) gene. The invention also relates to compositions and methods for hablotyping and/or genotyping the GPR31 gene in an electron of individual. Polymucleotides of the invention are useful in studying the individual. Polymucleotides of the invention are useful in studying the expression and function of GPR31, and in expressing GPR31 protein for use consider and in studying the effect of GPR31, and in expressing GPR31 protein for use and in studying the effect of the variation on the biological activity of GPR31 as well as on the binding affinity of candidate drugs targetting companies of the haplotyping method is useful for improving the efficiency and creating issaess associated with GPR31 activity e.g. cancer. This can also be used by the pharmaceutical research scientist to validate companies of the treating a specific condition of clinical trials of candidate drugs, for treating a specific condition drugs or disease condition and also be associated with GPR31 activity. The present sequence is an allele specific oligonucleotide (ASO) probe used to detect human GPR31 gene polymorphisms

The invention describes a method of increasing the yield of a protein from a cell culture. The method comprises switching cells from a replicative to a productive or pseudo-senescent state in one or more cells in the cell culture by transforming cells with a vector expressing a cell cycle inhibitor. The cells can then be maintained in culture for longer periods of time, allowing protein fraction to be collected from the cell culture. The method is particularly useful for allowing controlled protein biosynthetic productivity of cell lines for commercial and research purposes. This sequence represents a tetracycline operator sequence that can be incorporated into the tetracycline regulated retroviral vectors described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Increasing the yield of a protein from a cell culture, particularly useful for controlled protein biosynthesis of cell lines for commercial or research purposes, comprises causing a pseudo-senescent state in the cell(s) of the culture.
                                                                                                                                  Tetracycline regulated retroviral vector related tetracycline operator.

```
The present invention relates to a new polymucleotide comprising a nucleotide sequence which is a polymorphic variant of a reference connected sequence for lecithin-cholesterol acyltransferase (LCAT). The invention is useful for lecithin-cholesterol acyltransferase (LCAT). The invention cisquence for lecithina association between a trait (preferably a clinical response to drug targeting LCAT) and at least one genotype or haplotype of LCAT gene. The method of the invention has applicability in developing diagnostic tests and therapeutic treatments for Norum disease. The construction and anterosclerctic cardiovascular disease. The flash-eye disease and atherosclerctic cardiovascular disease. The complexity, anthropological lineage, the significance of diversity and lineage at the phenotypic level, patentity testing, forensic applications diversity, anthropological lineage, the significance of diversity and lineage at the phenotypic level, patentity testing, forensic applications and for identifying the LCAT genetic variation and a trail such as level of drug response or susceptibility to disease. In addition, the methods for identifying the LCAT haplotypes present in individuals are useful in the development of drugs targeting the LCAT haplotypes in a population with a specific disease, e.g. Norum disease, will facilitate the development of a collection (ABRG7492-ABRG7519) of allele specific colligonucleotide (ASO) primers that were used in the invention to detect polymorphisms in the human LCAT gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, protease inhibitor, PI4; kallistatin; therapy, polymorphic site; PS; haplotyping; genotyping; acute pancreatitis; drug screening; antiinflammatory; chromosome 14q31-q32.1; probe; ss.

```
The present invention describes an isolated human period (Drosophila)

homologue 1, (PERI) polymucleotide (I) comprising a sequence which is a

conjugation variant for a reference sequence (ABL52077) for the PERI gene

or itse fragment, or a polymorphic variant of a reference sequence

(ABL52078) for a PERI cDNA or its fragment. The present invention also

describes methods for genotyping and haplotyping the PERI gene of an

individual. (I) is useful in studying the expression and function of

PERI, and in expressing PERI protein for use in screening for candidate

cransfected with (I) can be used for studying expression of the PERI

isogenes in vivo, for in vivo screening and testing of drugs targeted

against PERI protein, and for testing the efficacy of therapeutic agents

and compounds for disorders associated with circadian rhythm regulation.

The present sequence represents an allele specific oligonucleotide primer

for human PERI, which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                         homolog 1 polynucleotide, useful the expression and function of the homolog.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to genotyping protease inhibitor (PI) 4

(kallistatin) gene of an individual, involves determining for the two
copies of the PI4 gene present in the individual, the identity of the
nucleotide pair at one or more polymorphic sites. PI4 gene is located on
chromosome 14931-932.1 Genotyping is useful for determining if an
chromosome 14931-932.1 Genotyping is useful for determining if an
condition. Haplotype or haplotype pairs defined in the
specification. Haplotyping is useful for improving the efficacy and
creating diseases associated with PI4 activity, e.g. acute
condition or disease predicted to be associated with PI4
activity, and in the design of clinical trials of candidate drugs for
treating a specific condition or disease predicted to be associated with
Controlly and in the design of clinical trials of candidate drugs for
treating a specific condition or disease predicted to be associated with
Clunction of PI4, and in expressing PI4 protein for use in screening for
candidate drugs to treat diseases related to PI4 activity. The present
candidate drugs to treat diseases related to PI4 activity. The present
condicate drugs as the protein for use in screening for present and manning for present and manning for present pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ·

Novel genetic variants of Solute Carrier Family 1 (Glutamate/Neutral Amino Acid Transporter), Member 4 isogenes, for improving efficiency and reliability in drug development for treating cancers.

WPI; 2002-519580/55

```
The present invention describes an isolated human period (Drosophila) homologue 1, (PERI) polymucleotide (I) comprising a sequence which is a polymorphic variant for a reference sequence (ABL52079) for the PERI gene or its fragment, or a polymorphic variant of a reference sequence sequence (ABL52078) for the PERI gene of an includual. (I) is useful in studying the expression and function of pERI, and in expressing PERI protein for use in screening for candidate drugs to treat diseases related to PERI activity. (I) is useful for transfected with (I) can be used for studying expression of the PERI isogenes in vivo, for in vivo screening and testing of drugs targeted against PERI protein, and for testing the efficacy of therapeutic agents and compounds for disorders associated with circadian rhythm regulation. The present sequence represents an allele specific oligonucleotide primer for human PERI, which is used in the exemplification of the present
                                                                                                                                                                         Novel isolated human period Drosophila homolog 1 polymucleotide, useful for therapeutic purposes, for studying the expression and function of the polymucleotide, and for expressing the homolog.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Solute carrier family 1; SLC1A4; haplotyping; human; cancer; primer; glutamate/neutral amino acid transporter; neurological disease; PCR; ss; amino acid transporter disorder; single nucleotide polymorphism; SNP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Solute Carrier Family 1 (SLC1A4) allele-specific oligonucleotide #62

The invention relates to an isolated polymucleotide (I) comprising a first nucleotide sequence which comprises solute carrier family 1 (2) that nucleotide sequence which comprises solute carrier family 1 (2) cilian an isolated polypeptide (III) comprising an amino acid sequence (II) and an isolated polypeptide (III) comprising an amino acid sequence which is a polymorphic variant of a reference sequence for SLCIA4 gene of an individual; (2) predicting a haplotype pair of SLCIA4 gene of an individual; (2) predicting a haplotype pair for SLCIA4 gene of an individual; (2) predicting a haplotype pair for SLCIA4 gene of an individual; (3) identifying an association between a trait and at least one haplotype or haplotype pair of SLCIA4 gene. (III) Is useful in screening for drugs targeting (III) that are useful for treating cancer, neurological diseases and amino acid transporter disorders. The methods are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating corporated with SLCIA4 activity. The haplotyping method is also used by the pharmaccutical research scientist to validate SLCIA4 as secondated with SLCIA4 activity, e.g. cancer, neurological diseases or candidate target for treating a specific condition of disease associated with SLCIA4 activity, e.g. cancer, neurological diseases creaming scories of targeting SLCIA4. Anti-SLCIA4 antibody is useful in diagnostic, prognostic and therapeutic methods. ABK95761-ABK95807 represent SLCIA4 and related PCR primers used to identify single nucleotide polymorphisms companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SCYA24; human; small inducible cytokine; isogene; antiasthmatic; asthma; gene therapy; respiratory inflammatory disease; polymorphism; primer; ss

```
The invention relates to a novel isolated polynucleotide comprising a small inducible cytokine subfamily A (cye-cys), member 24 (SCYA24) isogene. The polypeptide of the invention has antiasthmatic activity. The polynucleotide may have a use in gene therapy. The polynucleotide and polynucleotide are useful in the the development of drugs for treating diseases associated with SCYA24 activity, e.g. respiratory inflammatory diseases such as asthma. Allele-specific oligonucleotide (ASO) primers used for detecting polymorphisms in the SCYA24 gene are represented in ABLS7616-ABLS7645
                  New genetic variants of small inducible cytokine subfamily A member 24 gene, useful in studying expression and function of the protein, and for screening drugs to treat diseases such as asthma.

Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.

Claim 2; Page 35; 276pp; English.

The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is

Novel polymucleotide containing polymorphisms in intercellular adhesion molecule 2 gene, useful in developing drugs for treating human immunodeficiency virus infection and inflammatory diseases.

Claim 16; Page 13; 81pp; English.

The invention relates to single nucleotide polymorphisms in the gene encoding human intercellular adhesion molecule 2 (ICAM2). A method for haploryping the ICAM2 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the ICAM2 haplotypes given the specification or whether both copies are defined by a haplotype given in the specification or whether both copies are defined by a haplotype con in the specification or whether both copies are defined by a haplotype or haplotype pair of the ICAM2 gene can be trait and a haplotype or haplotype pair of the haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair in the trait with the frequency of the haplotype or haplotype pair. ICAM2 and its corresponding DNA are used for studying the expression and function of ICAM2, for use in screening

The invention relates to a method of genotyping bovine for improved milk production traits which comprises determining the diacylglycerol exploration traits which comprises determining the diacylglycerol exploration of the bovine, wherein the DGATI genotypic state of the bovine, wherein the DGATI improved milk production traits. The method is useful for selecting a bovine having a desired DGATI genotypic state. It is also useful for the identification and selection of a bovine having one of the polymorphisms in its DGATI gene. Milk produced from selected bovine which is useful for making a dairy product provides a beneficial health effect. An antibody to the protein having DGATI in a lactating bovine so as to modulate milk
                                                                                                                                                                                                           ô
for candidate drugs to treat diseases related to ICAM2 activity, such as HIV infection and inflammatory diseases. The sequences are also useful for studying the effect of variation on the biological activity of ICAM2 as well as on the binding affinity of candidate drugs targeting ICAM2. Sequences AAS95362-AAS95417 and AAS95419-AAS9542 represent allelespecific oligonucleotide probes, sequencing primers, PCR primers and CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determining genetic merit of a bovine with respect to milk composition and volume for improved milk production, comprises determining the diacylglycerol acyltransferase gene genotypic state of the bovine.

The invention comprises the amino acid and coding sequence of the human N accepylgalactosaminidase (NAGA) alpha protein. The invention specifically comprises novel polymorphic sites identified within the NAGA gene. The NAGA gene is located on chromosome 22q13.2-q13.31, and encodes a lysosomal glycohydrolase that cleaves alpha-N-acetylgalactosaminyl moieties in glycoconjugates. The NAGA pNA and protein sequences of the invention are useful for studying the expression and function of NAGA and for screening candidate drugs to treat diseases related to NAGA activity. The NAGA gene polymorphisms identified in the present invention are useful for haplotyping and genotyping the NAGA gene of an individual. The present DNA, sequence represents an N-acetylgalactosaminidase gene allele-
                                                                                                                                                                                                                                             ö
production and/or milk solids content. DGAT1 nucleic acid and its fragments are useful in the farming industry. They are also useful to generate transgenic animals which are useful to investigate the molecular basis of DGAT1 action and to test a substance for the ability to prevent, slow or enhance DGAT1 activity. The present sequence is a PCR primer used for amplifying boxine DGAT1 gene polymorphic region. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New genetic variants of isolated N-acetylgalactosaminidase (NAGA), Alpha gene, useful for therapeutic purposes, for studying the expression and function of the polynucleotide, and for expressing NAGA protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; PCR; primer; 88; gene therapy; N-acetylgalactosaminidase alpha; chromosome 22q13.2-q13.31; lysosomal glycohydrolase; screening; SNP; NAGA-related disease; single nucleotide polymorphism; haplotyping; NAGA;

Human, natriuretic peptide receptor A/guanylate cyclase A, NPR1; ss, artionatriuretic peptide receptor A, haplotyping, cytostatic; genotyping, haplotype pair; single nucleotide polymorphism; gene therapy; PCR primer; drug screening; hypertension; hypotensive; sequencing primer; probe.

Human NPR1 gene allele-specific oligonucleotide probe #5.

(first entry)

12-MAR-2002

```
The invention relates to haplotyping the apolipoprotein C-IV (APOC4) gene of an individual, comprising determining if the individual has one of the APOC4 haplotypes or haplotype pairs fully defined in the specification. Haplotyping the APOC4 gene of an individual, comprises determining the identity of the nucleotide at two or more polymorphic sites in one copy of the gene. The method also comprises identifying an association between a trait and a haplotype pair of the APOC4 gene, comprising the trait midth that of a reference population. A higher frequency in the trait with that of a reference population. A higher frequency in the trait population indicates the trait is associated with the haplotype. The polynucleotides and screened compounds are useful for developing treatment for diseases associated with APOC4 activity such as hypertriglycerideamia. AASSSS80-AASSSSG4 represent human apolipoprotein C

The invention relates to single nucleotide polymorphisms in the gene encoding the human natriuretic peptide receptor A/guanylate cyclase A carriomatriuretic peptide receptor A/guanylate cyclase A carriomatriuretic peptide receptor A, or NPRI polypeptide. A method for haplotyping the NPRI gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the NPRI haplotypes given in the specification or whether both copies are defined by a haplotype or in the specification or whether both copies are defined by a haplotype or haplotype pair of the haplotype or haplotype pair of the haplotype or haplotype pair or a population exhibiting the trait with the frequency of the haplotype or haplotype or haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype or haplotype pair. NPRI and its corresponding DNA are used frequency in the trait population indicates the trait is associated with the haplotype or haplotype and function of NPRI, for use in screening for candidate drugs to treat diseases related to NPRI activity, such as hypertension. The sequences are also useful for studying the effect of variation on the biological activity of NPRI sequences AAS99990 and ABK09390-ABK09462 represent probbes, sequencing primers and PCR primers used to detect NPRI gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gene of

Claim 16; Page 15; 71pp; English.

The invention relates to haplotyping the human apolipoprotein A-IV habbah) game of an individual, comprising determining if the individual has one of the APOA4 haplotypes or haplotype pairs fully defined in the specification. Also disclosed are genotyping oligomuclectides (or allele particular haplotype pair with a trait e.g. obesity, in a population. The particular haplotype pair with a trait e.g. obesity, in a population. The APOA4 gene is located on chromosome lag33-qter. The methods of the associated with abnormal APOA4 expression or function, for example coronary heart disease and atherosclerosis. The APOA4 isogenes and screened compounds are useful for the treatment of disorders associated with abnormal APOA4 expression or function such as coronary artery disease. The present sequence is an APOA4 allele specific oligonuclectide, ASO, PCR primer used to detect an APOA4 polymorphism

Human IL8RB gene allele-specific oligonucleotide sequencing primer #20

Human; interleukin 8 receptor beta; IL8RB; ss; antiinflammatory; probe; haplotypying; haplotype palx; single nuclectide polymorphism; genotyping; gene therapy; drug screening; chronic obstructive pulmonary disease; inflammatory disease; sequencing primer; PCR primer.

Homo sapiens,

WO200179221-A2

```
The invention relates to single nucleotide polymorphisms in the human interleukin 8 receptor beta (ILBRB) gene. A method for haplotyping the Library and a receptor beta (ILBRB) gene. A method for haplotyping the Library and determining whether one of the copies of the gene is defined by one of the ILBRB haplotypes given in the copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. The method is useful in genotypes. An association between a trait and a haplotype or haplotype pair of the ILBRB gene can be identified by comparing the frequency of the haplotype or haplotype pair of the haplotype pair in a reference population, where a higher haplotype or haplotype pair. ILBRB gene can be identified by comparing the trait population indicates the trait is associated with haplotype pair in a reference population. Where a higher haplotype or haplotype pair. ILBRB and its corresponding DNA are used for studying the expression and function of ILBRB, for use in screening for studying the expression and feather inflammatory disorders. The sequences are also useful for studying the effect of variation on the biological activity of ILBRB as well as on the binding affinity of candidate drugs targeting ILBRB as well as on the binding affinity of candidate drugs targeting ILBRB is Sequencing primers and PCR primers used to detect ILBRB gene polymorphisms
                                                                                                                                                                                                                                                                                              New polymorphic variants comprising interleukin-8 receptor beta (isogene, useful in expressing ILBRB protein for use in screening candidate drugs to treat diseases related to ILBRB activity, e.g. inflammatory disorders.
                                                                                                                                                                                                         Denton RR, Nandabalan K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 15 BP; 2 A; 6 C; 2 G; 4 T; 0 U; 1 Other;

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The cargymetic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV in the aubstrate sequences defined in the specification. The HCV in the specification of control and be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV inbozymes are also useful for treating a condition associated with HVV infection in conjunction with one or more other drug therapies, particularly type I interferon. The present conterface is given in the sequence of unknown function. Note: The present sequence is given in the sequence data but is not mentioned elsewhere in the specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at the sequence of sequence data for this patent was constituted in electronic format directly from the USPTO web site at Seguence 15 BP; 5 A; 6 C; 2 G; 0 T; 2 U; 0 Other;

                                                                                                                                                                                                                                                                              The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mENA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK22770 represent human colon and pancreatic cancer SAGE tags of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                             New human nucleic acid containing specific SAGE tags, useful as diagnostic markers for cancer, also derived probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

Novel genetic variants of acid phosphatase 2, lysosomal polypeptide gene useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. Hodgkin's disease.

Claim 17; Page 14; 109pp; English.

The invention comprises the human lysosomal acid phosphatase 2 (ACP2) nucleic acid and protein sequences. Specifically, the invention relates to the discovery of 22 novel polymorphic sites within the APC2 gene. The invention also comprises methods for haplotyping and genotyping the ACP2 gene in an individual. The ACP2 gene (located on chromosome 11) encodes a lysosomal-specific enzyme that cacalyses the hydrolysis of orthophosphoric monoesters to alcohol and phosphare. The ACP2 gene and protein are pharmaceutically important in the treatment of Hodgkin's protein are pharmaceutically important in the treatment ACP2 gene and polymorphisms of the invention are useful in haplotyping the ACP2 gene. ACP2 haplotyping is useful in validating ACP2 as a target (and designing

```
disease and acid phosphatase deficiency). The ACP2 gene polymorphisms are useful for ACP2 gene typing, which can also be used to develop diagnostic tests and therapeutic treatments. The ACP2 protein and mucleic acids of the invention are useful in the ACP2 protein and mucleic acids of the invention are useful in the production of a transgenic animal which useful in the production of allele-specific oligonucleotides designed to genotype each of the ACP2 polymorphisms. Nucleic acids ABL36299-ABL3630 represent claimed ACP2 allele-specific probes. Nucleic acids ABL36321-acids ABL3644 represent claimed ACP2 allele-specific PCR primers. Nucleic acids ABL36321-acids ABL36364 represent claimed ACP2 allele-specific PCR primers. Nucleic

Novel cholinergic receptor, muscarinic 5 polynucleotide useful therapeutically and in screening for candidate drug to treat diseases related to the receptor activity.

Claim 14; Page 13; 72pp; English.

The present invention relates to a new cholinergic receptor, muscarinic 5 (CHRM5) polynucleotide comprising a sequence which is a polymorphic variant for a reference sequence for the CHRM5 gene or its fragment, or a polymorphic variant of a reference sequence for a CHRM5 cDNA or its fragment. The invention is useful in drug screening assays. The molecules of the invention are useful in studying the expression and function of CHRM5, and in expressing CHRM5 protein for use in screening for candidate drugs to treat diseases related to CHRM5 activity. The methods of the invention are useful in developing diagnostic tests and therapeutic treatments. The method is also useful in the design of clinical trials of candidate drugs for treating specific condition or disease associated with CHRM5 activity and is useful in determining whether an individual

is profoundly improved over the use of each of the medicaments alone. The sequences presented in AbX75990-ABX76123 are the immunostimulatory nucleic acids disclosed in the invention

```
The invention discloses a pharmaceutical composition comprising an immunostimulatory nucleic acid and either an anaemia medicament.

I thrombocytopenia medicament or a neutropenia medicament formulated in a carrier. The immunostimulatory nucleic acid can be selected from a methylated CpG nucleic acid, a T-rich nucleic acid, a poly-G nucleic acid, and/or a nucloic acid having a phosphorothicate backbone. The and/or a nucleic acid having a phosphorothicate backbone in the compositions can be used for the treatment or prevention of anaemia, thrombocytopenia and neutropenia in a subject preparing to undergo chemotherapy, radiation treatment, and has received at least one dose of chemotherapy or radiation treatment. The treatment is required due to the effect of Stress, including chemotherapy, on the formation of red blood cells, haematopoiesis. The composition provides a synergistic effect of the permits a lower dose of the medicament to be used, thus providing lower costs associated with using lower doses of the medicament, and reduced chances of inducing side effects. The efficacy of the combination
                                                                                                                                                                                                                                                           ö
has one of the haplotypes or one of the haplotype pairs. The invention is useful in a variety of diagnostic and prognostic formats and therapeutic methods. The invention is also useful in genotyping and/or haplotyping the CHRMS gene in an individual. The present nucleic acid sequence trepresents one of a collection of allele-specific oligonucleotide (ASO) probes (ABKR1765-ABK81774) that were used in the invention to detect polymorphisms in the human CHRMS gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ss; immunostimulatory nucleic acid; anaemia; thrombocytopenia; neutropenia; methylated CpG nucleic acid; T-rich nucleic acid; poly-G nucleic acid; phosphorothioate backbone; chemotherapy; radiation treatment; stress; red blood cell; haematopoiesis; symergistic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pharmaceutical composition for treatment of anemia, thrombocytopenia and neutropenia comprises an immunostimulatory nucleic acid and a medicament for the respective disease.
                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                           ö

The invention relates to a method of prevention or treatment of gastric ulcer comprising administering a nucleic acid to a subject in need for treatment of gastric ulcer. A nucleic acid sample comprising oligonucleotide 2006 was administered to a mouse model by an oral route or a vehicle control. Colonisation of mice by Heliobacter pylori was assessed at time points from 1 day to 1 month after treatment. The ability of the nucleic acid to reduce H. pylori colonisation was assessed. The method is useful for preventing or treating a gastric ulcer on a subject e.g. human or non-human vertebrate animal including dog, rabbit, turkey, chicken, primate, rat and mouse. The method effectively treats or prevents gastric ulcers. The present sequence represents an immunostimulatory nucleic acid for the treatment of gastric ulcers
                                                                                                                             ..

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 63; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRM), where (I) is an inozyme, zinzyme, G-Cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antiesne nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as condition disease, lugus, multiple sclerosis, transplant(graft rejection, gene therapy applications, ischaemia/reperfusion injury

Screening or diagnosing of Alzheimer's disease (AD) determine the stage or severity of AD in a subject, comprises analyzing a test sample of body fluid from the subject by 2-dimensional electrophoresis.

Disclosure, Page 93; 179pp; English.

The present invention relates to methods for screening or diagnosing Alzheimer's disease (AD) to determine the stage or severity of AD in a subject, to identify subject at risk of developing AD, or to monitor the effect of therapy administered. The methods comprise analysing a test sample of body fluid by 2-dimensional electrophoresis to generate a 2-dimensional array of AD-associated features (AFS). The method alternatively comprises quantitatively detecting in a sample of body fluid from the subject, one or more AD-associated protein isoforms (APIS, ABRS§710-ABRS9184). The present sequence is a probe, used to illustrate the invention

Treatment of a subject having, or at risk of developing cancer, involves the use of an immunostimulatory nucleic acid having a modified backbone in combination with a cancer medicament.

Disclosure, Page 7; 32pp; English.

The invention describes a method of treating (T1) a subject having cancer involving administering an immunostimulatory nucleic acid (1) having modified backbone and a cancer medicament (M1) selected from conference medicament (M1) selected from chemotherapeutic agent, cancer vaccine or hormone therapy. The poly-G mucleic acid is not conjugated to (M1) and is for the organism of the organism of the reatment of cancer (e.g. bone cancer, brain and CNS cancer, connective tissue cancer, ossophageal cancer, eye cancer, Hodgkin's lymphoma, larynx cancer, oral canter, exin cancer, Hodgkin's lymphoma, larynx cancer, oral canter, exin cancer, mid else preventing allergic responses in those receiving blood transfusions. It is also useful for the treatment of fungal bacterial, parasitic and viral infections. The combination of the immunostimulatory nucleic acids and the cancer medicament is synergistic. The combination allows for the administration of lower, sub-therapeutic doses of either compound, but with higher efficacy than would otherwise be achieved using such low doses. The immunostimulatory nucleic acids cosing regimens, improving compliance and maintenance therapy, reducing dosing regimens, improving compliance and maintenance therapy, reducing compresents an immunostimulatory nucleic acids in the method of repersoring cancer represents an immunostimulatory nucleic acid in the method of treating cancer described in the invention

New compositions comprising an immunostimulatory nucleic acid and an oil-in-water emulsion, useful for reducing viral shedding or tissue damage upon vaccination, or for inducing an immune response against infectious diseases

Claim 34; Page 34; 68pp; English.

The invention relates to a composition comprising an immunostimulatory nucleic acid (especially a CpG dinucleotide containing oligonucleotide) and an oil-in-water emulaion. Also included are reducing viral shedding in a non-human animal (by administering to a non-human animal infected with a virus or at risk of viral infection, an immunostimulatory nucleic acid and an oil-in-water emulaion), reducing tissue damage anishing the administering to a subject by an invasive coute an adjuvanted vaccine and an immunostimulatory nucleic acid to reduce tissue damage arising from the adjuvanted vaccine, where the conformation of a subject by a minumated vaccine and an immunostimulatory nucleic acid to response (by administering to a subject an oil-in-water emulsion and a conformation of a subject an oil-in-water emulsion and a coponse (by administered to a subject an oil-in-water emulsion and a coponse comprising administering to a subject an antigen specific immune response comprising administering to a subject to produce an antigen specific immune response comprising administering to a subject an antigen in a subject composition is useful for reducing viral shedding in a non-human animal composition is useful for reducing an immune response to treat or prevent infectious diseases, for reducing a dosage of antigen confusion, for inducing an immune response to treat or preventing or preventing concert, becaucing or preventing concert, becaucing or preventing cancer, of concert, bear and for treating or preventing cancer, oseophageal cancer, skin cancer, indection leading to AIDS) and fungal (e.g. candidasis) concert, skin cancer sequence is an immunostimulatory oligonucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human monoclonal antibody that binds to human CD30. The antibody is useful for treating or preventing tumour or autorimnume disease e.g. rheumatoid arthritis, systemic lupus erythematosus, systemic sclerosis, atopic dermatitis, Grave's disease, Hashimoto's thyroiditis, Wegner's granulomatosis, Omen's syndrome, chronic renal failure, acute infectious mononucleosis, harpes or HIV (human immunodeficiency virus) virus-associated diseases. The antibody is also useful for treating Hodgkin's disease, anaplastic large cell
                                                                                       ô
                                                                                                                                                                                                                                                                                                                     Human; antibody; CD30; tumour; autoimmune disease; rheumatoid arthritis; systemic lupus erythematosus; systemic sclerosis; Grave's disease; ALCL; satopic dematitis; Hashimoto's thyroiditis; chronic renal failure; ALLD; acute infectious mononucleosis; angioimmunoblastic lymphadenopathy; HIV; Hodgkin's disease; Castleman's disease; Kaposi's sarcoma; lymphoma; ATL; wedlut T call lymphoma; human immunodeficiency virus; carcinoma; therapy; Wegner's granulomatosis; analpatic large cell lymphoma; therapy; heavy chain variable domain; VH; complementarity determining region; CDR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human monoclonal antibody that binds to human CD30, useful for treating or preventing tumor or autoimmune disease, e.g., rheumatoid

The method is useful for treating non-allergic inflammatory disease. The method is psoriasis, eczema, allergic contact dermaticis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                Gaps

HNF-lalpha;

```
The invention relates to an improved primer discrimination method in allele-specific primer extension (ASPE). The invention also relates to primers useful in ASPE methods, which has in 3' portion an allelespecific nucleotide complementary to allelic variation nucleotide of target nucleic acid and an artificial mismatch nucleotide. The primers are useful for increasing discrimination between primers in ASPE. The ASPE method is useful in detecting a single point mutation as well as insertion and deletion variations. The present sequence is a probe(primer) used to detect variations in human HNP-1 alpha (hepatocyte nuclear factor-1) mutant exon 2. This sequence is used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel primer for use in allele-specific primer extension, has in 3' portion an allele-specific nucleotide complementary to allelic variation nucleotide of target nucleic acid and an artificial mismatch nucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ds, allergy, asthma, poly-G nucleic acid; aerosol formulation; hypo-responsive subject; immunostimulatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.5%; Score 11.4; DB 1; Length 15; 92.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides single-stranded (ss) DNA molecules that are generated intracellularly and are active in mediated triplex-dependent and/or recombinagenic chromosomal events within the cells and/or recombinagenic chromosomal events within the cells mid-or the cellular compartments. These oligonucleotides can be produced within the cells by providing a vector or plasmid which generates not only the oligonucleotides in the cells, but also a fusion protein which is both a reverse transcriptase and a restriction enzyme. The ssDNA may be produced directly, or initially as a stem-loop structure, which is then cleaved to yield ssDNA. The triplex-forming oligonucleotide can be studying DNA repair, for gene therapy, for generating new strains of studying DNA repair, for gene therapy, for generating new strains of transmuted animals or plants, and in functional genomics. The present sequence is that of a PCR primer to sa triplex-forming oligonucleotide Ad34 (see ACPOSOS) or its reverse, and was used to detect ssDNA in mouse FL-10 cells following vector transfection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inducing a specific change in a target chromosomal nucleic acid molecule by introducing (into a cell) a nucleotide molecule encoding a reverse transcriptase or a RNA to be reverse transcribed into single stranded

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to genotyping/haplotyping the cholinergic receptor, nicotinic, beta-polypeptide 2 (neuronal) (CHRNB2) gene of an individual,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Genotyping cholinergic receptor, nicotinic, beta-polypeptide 2 gene of an individual involves determining for two copies of the gene, the identity of nucleotide pair at polymorphic sites selected from PS1-24.
                                                                                                                                                                                                            The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                  Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                            ö

compitating uretimining to the two cupres of the individual, the identity of the nucleotide pair at one or more the individual, the identity of the nucleotide pair at one or more polymorphic sites selected from FS1-24. Also include are oligomucleotides corrections the method and the nucleotide sequence of the polymorphic variants of CHRNB2. The method is useful for detecting novel CHRNB2.

Conjumorphisms and for determining if an individual has a haplotype or polymorphisms and for determining if an individual has a haplotype or candidate agent for treating a specific condition or disease predicted to be associated with CHRNB2 activity (e.g. a memory disorder, Alzheimer's candidate agent for treating disorder, schizophrenia, attention of disease, pellepsy, alearning disorder, schizophrenia, attention of disease, pellepsy (ADNFLE)), and in the design of clinical trials of frontal lobe epilepsy (ADNFLE)), and in the design of clinical trials of conditions or disease predicted to compounds targeting CHRNB2 octivity. The method is useful to screen for compounds targeting CHRNB2 activity. The method is useful to screen for compounds the expression and function of CHRNB2 and in expressing in brudying the expression and function of CHRNB2, and in expressing cHRNB2 protein for use in screening for candidate drugs to treat disease callated to CHRNB2 activity and are useful for therapeutic purposes. The CHRNB2 gene is located on chromosome 1q21. The present sequence is an expensive invariant procession and function for performing the method of the invariant collection of the method of the condition of the condition of the method of the condition of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

pseudonucleotides which contain anthraquinone. These oligomers were

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an cantiferate oligonucleotide, (for Insulin-like Growth Factor [106]-1 creceptor, IEF binding protein [IGFB]-2 or IGFBF3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAF45151 and AAF45153-Crichthyosis, pityriasis, ruba, pilaris, serborthoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hypernecovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperplasia
                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modified oligo:nucleotide(s) conjugates to anthraquinone - useful as anti-sense agents for treating and diagnosing diseases.
                                                                                                                                                                                                                                                                                                                                                            Gaps

The Ligase Chain Reaction has been improved to increase the "flexibility" or "dynamic range" of each probe set used in the detection of small mutations (single base deletions, insertions and changes, as well as multiple mutations where the size of the mutation is less than about 15% of the average probe length). Previously the determination of the genetic constituency of an individual has been time consuming. The invention nucleic acid) under hybridising conditions that have been modified - 1. the concentration of monovalent cation (Na+, K+, or NR3H+; R = H or lower alkyl) is 100-200mM; 2. a "hot start" (temp. range 50-95 degree C) may be

used; and 3. one of the downstream probes has a mismatch within 5 bases from the 5' end so it is not complementary to the target sequence (The complementary probe is also mismatched). These may be used either on their own or in conjunction. AAQ72439 and AAQ72440 are used to detect the G542X mutation in cystic fibrosis. The remaining probes are selected from applicable to other disease related mutations. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence shows an intron-exon boundary of the human haemopoietin receptor NR2 gene. Genomic libraries were screened to obtain genomic clones of the NR2 locus. These clones were characterized by mapping with partial endonuclease digestion, and specific probes were used to determine which fragments contained exon sequences. Intron/exon junction

Genomic libraries were screened to obtain genomic clones of the NR2 locus. These clones were characterised by mapping with partial endonuclease digestion, and specific probes were used to determine which fragments contained exon sequences. Intron/exon junction sequences (see AATG4459-86) were determined by sequencing across intron/exon boundaries and confirmed by PCR. NR2 (see also AAM14841) and genetic sequences encoding it (see also AATG4442) can be used in the
sequences (see AAT64459-86) were determined by sequencing across introni-exon boundaries and confirmed by PCR. MRZ (see also AAM44841) and genetic sequences encoding it (see also AAT6442) can be used in the development of (ant)agonists, therapeutics and diagnostic reagents based

Using the SIP, salt can be used as a food-grade inducer in food fermentation processes, e.g. in the production of cheese, dressings, water-containing spreads, sausages, or sour dough
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Salt-inducible promoter - derived from lactic acid bacteria, used for the production of polypeptides in food.

The present invention describes an isolated nucleotide sequence (I) encoding at least a portion of the human alpha-7 neuronal nicotinic encoding at least a portion of the human alpha-7 neuronal nicotinic acetylcholine receptor (alpha7-hnAchR). Also described are: (I) a peptide encoded by (I); (2) a vector comprising (I); (3) a host cell transformed with a vector of (2); (4) a polymucleotide comprising at least 15 nucleotides which hybridises under stringent conditions to at least a portion of (I); (5) a method for detection of a polymucleotide encoding alpha 7-hnAchR. The primers and probes from the present invention can be used on brain tissue and probes from the present invention can be used on brain tissue and blood samples of humans suspected of suffering from schizophrenia, small cell lung carcinoma, breast cancer and nicotine-dependent illness. This is particularly useful studied/diagnosed are epilepsy (e.g. juvenile myoclonic epilepsy) and prader-Willi and Angelman's syndromes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ő

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a cibozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a concleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antisiabetic, and cophhalmological, vulnerary, keratolytic and vincide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis atopic dermatitis, actinic keratosis, conclusion be used for treating proliferative eye diseases such as diabetic also be used for treating proliferative eye diseases such as diabetic cretinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn see a samplification of the present invention
                                                                                                                                                                                      Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   KRAB domain, hyperplasia, thyroid, tumor; zinc finger motif; primer; cytostatic, antithyroid; gene therapy; chromosome 19; 19q13; ss.

invention

ព្ពង្គ

```
The invention relates to a novel isolated molecule comprising bases 2-8 or 13-16 of 2 16 base pair sequences, or comprising a 1731 base pair sequence, all given in the specification or at least 95 % identity with the 1731 bp sequence. The mucleic acid molecule is useful in regulating apoptosis in cells and in drug screening. The method is useful in that can facilitating the induction of apoptosis in cells, in identifying an agent that can facilitate the induction of apoptosis in cells, and in inhibiting the growth of a cancer. This polymuclectide sequence represents a ribozyme binding substrate sequence relating to the
                                                                                                   This invention describes a novel nucleic acid (NI) encoding a polypeptide which comprises a KRAB-domain and/or at least one zinc finger motif. The products of the invention have cytostatic and antithyroid activity and can be used in gene therapy. Nucleic acids, polypeptides, and antibodies of the invention may be used in the diagnosis and/or the therapy of the malfunction of the thyroid and/or hyperlasais of the thyroid and/or thyroid and/or they also be used in the production of medicaments. (NI) can also be used to diagnose thyroid tumors which are located on thromosome 19 at band 19413. This sequence represents a PCR primer used in the isolation of the thyroid malfunction-associated protein, RITA which is described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid molecule useful for regulating apoptosis induction in cells, for inhibiting the growth of cancer in subjects, and for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
          New nucleic acid useful for the diagnosis and treatment of thyroid disorders, e.g. tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                    ;

The nucleic acid molecule is useful in regulating apoptosis in cells and in drug screening. The method is useful in facilitating the induction of apoptosis in cells, in identifying an agent that can facilitate the induction of apoptosis in cells, and in inhibiting the growth of a cancer. This polymucleotide sequence represents a ribozyme binding substrate sequence relating to the

```
The invention relates to an isolated nucleic acid (NI) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter properating as ADE1380. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter or promoter, a host cell comprising the promoter operably linked to a promoter operably linked to a promoter reach of dagnosing or prognosing glaucoma in a sample containing to promoter operably linked to a promoter reach of the optineurin gene, associated with a glaucoma phenotype), detecting a SNP sequence variation in a sample containing DNA, detecting the presence of an optineurin promoter sequence variation in a sample containing DNA, detecting the presence or increased a sample containing DNA determining the presence or increased containing in loss of visual field in a patient for the severity or progression of glaucoma in a patient, comprising providing an eaction primers that direct amplification of a selected nucleic acid region containing the variation within the optineurin optineurin promoter and and plancaming human genomic DNA, providing a nucleic acid region containing human genomic DNA, providing a nucleic acid ceptable of detecting a SNP ploated within an optineurin promoter, and catched the presence of an optineurin promoter, and catched within an optineurin promoter, and
                                                                                                                                                                                                                                                                      Human, optineurin; ds; ophthalmological; single mucleotide polymorphism; SNP; glaucoma; progressive ocular hypertensive disorder; glaucoma related disorder; motif; repeat element; regulatory region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    detecting the polymorphism). The invention is used to diagnose and prognose glaucoma and also to treat glaucoma related disorders. The present sequence is an optineurin promoter motif, repeat element or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid (NI) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADB18890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter. Spromoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter region of the optineurin gene, associated with a sample obtained from a cell or bodily fluid (comprising detecting a polymorphism of the optineurin gene, associated with a glaucoma phenotype), detecting a SNP sequence variation in a sample containing DNA, determining the presence or increased susceptibility to glaucoma or to a progressive ocular hypertenaive concenting in loss of visual field in a patient (or the severity or progression of glaucoma in a patient, comprising providing a sample containing the variation within the optineurin containing the variation within the optineurin containing a sample containing the variation within the optineurin promoter and amplifying the DNA) and detecting a polymorphism (comprising capable of detecting a SNP) located within an optineurin providing a nucleic acid capable of detecting the polymorphism). The invention is used to diagnose and progression or progression containing human genomic DNA, providing a polymorphism. Or present sequence is an optineurin promoter motif, repeat element or provider or progression or progression or the polymorphism or present sequence is an optineurin promoter motif, repeat element or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and related
                                                                                                                                                                                                                              Human, optineurin, ds, ophthalmological, single nucleotide polymorphism,
SNP; glaucoma; progressive ocular hypertensive disorder;

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cegniates expression of a neurite growth inhibitor gene (NGGO). The cegniates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a possessing an NCH motif), a G-cleaver (Cleaving RNA with a NRA molecule or an amberzyme (cleaving RNA with an NGH worlf), a zinzyme (cleaving RNA with an NGH worlf), a zinzyme (cleaving RNA with an NGH worlf). The CD20-targetting nucleic acid is used to cleave RNA or CC for on the presence of advalent cation that is preferably Mg<sup>2</sup>+.

C Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more cherapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgxin; s lymphoma (NHL), bulky low-grade or follicular NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphoma, contacted acid inflammatory arthropathy. The NGGO ene in the character of a divalent cation that is preferably Mg<sup>2</sup>2+. Furthermore, the

The polypeptide can be expressed by standard recombinant methodology. The PDE7a3 splice variant polypeptides and polymucleotides are useful for treating cardiovascular diseases, asthma, allurapy, inflammatory diseases, fertility disorders and immunoregulator disorders. The polymucleotides are useful for producing transgenic animals, which include knock-in animals (in which an animal
nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of the treatment may further comprise the use of one or more therepies. In particular, the NOGO-tergetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA, grarkle), Alzelmer, disease, dementia, multiple sclerosis (MS), chemocherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), parkinson's disease, ataxia, Huntington's disease, Creuzzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modellation of NOGO expression. The present sequence is an amberzyme molecule of the invention

gene is replaced by human equivalent within the genome of the animal), useful in drug discovery process, for target validation. The PDE7a3 splice variant polypeptides and polymuclocitdes are useful as vaccines for inducing an immunological response in a mammal. Sequences ABL58392-93 represent PCR primers used to verify the existence of the novel PDE7a3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated DNA molecule which encodes a polypeptide capable of binding to an intracellular domain of a p55 tumous necrotic factor (TNF) receptor. The DNA molecule is useful for preparing a composition for treating tumour, rhematoid arthritis or inflammatory diseases. The invention is useful in gene therapy. The present sequence is a PCR primer used in the construction of soluble dimeric TNF receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense PCR primer, EC55 to construct soluble dimeric TNF receptor

This sequence represents a PCR primer for the human ACE (angiotensin converting enzyme) gene, and can be used in the method of the invention. The method is for assessing cardiovascular status in humans by determining the sequence of at least one polymorphic site in the ACE (angiotensin converting enzyme), AGT (angiotensinogen) and/or ATI (type I angiotensin II receptor) genes, and comparing the polymorphic pattern with predetermined markers of status. The method is used to assess blood pressure or electrocardiographic profile, to diagnose a cardiac condition such as (silent) myocardial infarction (MI), CC diagnose a cardiac condition such as (silent) myocardial infarction (MI), CC diagnose to treatments with ACE inhibitors, angiotensin II receptor antegonists, diuretics, alpha- or beta-adrenergic receptor antegonists, contained to identify susceptibility to cardiovascular consequence of includence of includence of cardiovascular contens and libraries of nucleic acids containing polymorphic positions in the 3 genes, and libraries of targets corresponding to the peptides from the pentides acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to a novel method of assessing the cardiovascular status in an individual and to newly identified polymorphisms in the genes encoding angiotensin-converting enzyme (ACB), angiotensin II receptor type 1 (ATI) and type 2 (AT2), angiotensin II receptor type 1 (ATI) and type 2 (AT2), angiotensing (AGT), remin, allowed encoderenty and comparisms and comparisms and comparisms and comparisms of the cardiovascular disease determining the sequence at one pattern of polymorphic positions within these genes, and comparing the pattern obtained from a population of individual with a reference polymorphic pattern obtained from a population of individual schibiting a pretern obtained from a population of individual schibiting a useful for determining the predisposition of an individual to cardiovascular disorders such as myocardial infarction, unstable angina, predicting the likely cardiovascular disorders such as myocardial infarction, unstable angina, predicting the likely cardiovascular factors of a pattern given a predicting the likely cardiovascular disorders and such of a retainment regimen. ACE inhibitors, beta-adranezgic receptor antagonists (beta-blockers) or calcium channel blockers). Cone or more polymorphic markers provides a basis for predicting the outcome of a treatment regimen. Fragments of the genes comprising a polymorphic site may be used as provides a passis for high throughput screening. The genes, and the proteins concides a passis for high throughput screening. The genes, and the proteins chapt encode are useful in the screening of potential cardiovascular chapters and problem for a particular drugs. Determination of an individual's polymorphic pattern reduces or eliminate patients from clinical trials who are predicted to be noncereased than a patroved for an adverse response, to a particular creatment regimen. Adverse results in an early trial can be evaluated correction. Substances publication of the the approved for a clinical trials who are predicted to be noncereasing the num
                                                                                                    Angiotensin-converting enzyme gene, ACE; polymorphism; polymorphic marker; cardiovascular disease; mycoradial infarction; unstable angina; hypertension; atherosclerosis; stroke; prognosis; drug screening; treatment outcome; human; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polymorphic pattern comprising polymorphic positions within genes encoding specific proteins, with reference polymorphic pattern.
                                                        Human angiotensin-converting enzyme (ACE) PCR primer, SEQ ID NO:9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Assessing cardiovascular status in humans involves comparing test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Norberg LT, Andersson MK,

In addition, the methods can be used to determine the effects of different types of treatment for individuals, and thus enables appropriate therapies to be prescribed. THE PCR primers shown in sequences AAC61201-C61371 were all used to demonstrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                at one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Assessing disease status in individual by determining sequence(s) at or or more polymorphic positions within the human genes encoding the protein(s) involved in physiological pathway associated with treatment

Transcriptional control recognition element recognition sequences may be recognised by control proteins and are involved in either enhancing or repressing transcription of associated sequences. TCR sequences include promoter elements, hormone receptor elements, viral, cellular, liver or tissue elements, etc. The sequence represents an exemplary tissue associated element, the immunoglobulin gene enhancer element mu E2. A typical application of the TCRE recognising oligonucleotides is inhibition of viral proliferation. See also AAQ30472-518. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New oligo-nucleotide(s) contg. transcription control recognition element - stabilised by covalent bonding of two DNA strands, act as decoys for regulatory protein to modulate specific RNA.
                                                                                                                                                                    The sequence is the complement of (250) (AAQ24927). The selected primer is used in practice of the single primer amplification reaction (SPAR). (Updated on 25-MAR-2003 to correct PN field.)
                                                          Nucleic acid sequence single primer amplification - useful for genomic variation analysis and polymorphism detection for restriction fragment length data.
                                                                                                                                                                                                                                                                                                                          Gaps

The sequences given in AAQ92112-211 are probes which were used in the detection of a mutant p53 gene sequence. The DNA to be detected is amplified using PCR and then these probes which are pref. labeled using 32-P gamma-ATP are used the them utant sequences. The primers and probes given in AAQ9209-219 are used in the method of the invention for detecting mammalian target DNA in sputum samples. Analysis of the target DNA is used to diagnose benign or malignant neoplasms of the lung. It is also useful for screening people at high risk or for monitoring progress of treatment of lung neoplasms. The method is based on the discovery that mutant terget DNA associated with lung cancer is present at detectable levels in sputum. Cells shed into sputum from head and neck cancers may also be detected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting target nucleic acid in mammalian sputum - particularly for diagnosis of lung neoplasia involving mutation(s) in the K-ras oncogene
                                                                                                                                                                                                                                                                                  Primer; polymerase chain reaction, amplify; mutant; K-ras; PCR; flanking region; amplification; probe; detection; sputum; diagnosis; benign; malignant; neoplasm; lung; lung cancer; head; neck; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Two TEG molecules joined via a phosphate group are attached to the 5' terminus. The adenosine residue at position 15 is attached to the 3' denosine residue by two TEG molecules which are joined via a phosphate group. The diol-contg. linking group forms phosphodiester bonds with both adenosines. The resulting oligonucleotide is resistant to exonuclease degradation. See also AAQ21884-Q21917

This invention describes the use of novel acidophilic and thermostable xylanase enzymes (XYL I and XYL II) from Actinomadura sp. FC7 which retain their activity under harsh industrial conditions (e.g. high temperature or wide pH ranges) and may be secreted by recombinant host cemperature or wide pH ranges Xylanases XYL I and XYL II are part of a large group of hemicellulase enzymes and function by cutting the beta-1,4 bonds within the xylosic chain of xylan (a polymer of D-xylose residues that is a major constituent of hemicellulose). This means that they may be used in the paper and pulp industry to improve the efficiency of the bleaching process by degrading the structure of the material. XYL I and XYL II may also be used to treat feed, by degrading a substrate with a high temperatures (e.g. 70 deg. C) and at low pis (e.g. 4.0), conditions which tend to denature most known xylanases. Enzymes that cartive in these conditions may be used in industrial processes that are cartied out at high temperature and low pit to speed up other, non-enzymatic reactions, minimising costs, energy requirements, and the facilitate chlorine bleaching of paper pulp which is carried out in hot, cidic conditions). Pretreatment with XYL I and XYL II, allows the bleaching agents to penetrate better, to remove lignin from the pulp and conditions the colouration from it of main smalls smaller guantities of the degents can be used to produce the same or a better result. Also, disrupting the structure aids water drainage. NOTE: This patent is an equivalent to F19503640. (Updated on 25-MAR-2003 to correct DR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New acidophilic and thermostable xylanase enzymes from Actinomadura sp. RC7 - useful for treating plant biomass, especially paper and wood pulp, to degrade hemicellulose and hydrolyse xylan.

PCR primer GSP 2 (AAT38471) is based on Ancylostoma secreted protein (ASP) genes (see also AAT38466-68), and is located internally to primer (SAP) genes also AAT38400. It was used with a S' poly(6) anchor primer (AAT38473) in a S'RACE PCR amplification of Ancylostoma canimum L3 larva cDNA. A second PCR using nested primers (see also AAT38472-73) yielded (AAT38466) coding for ASP-1 (AAW04321), a protein useful in hookworm vaccine, was identified
                                                                                                                                                                                                                                                                                                                                                  Ancylostoma caninum secreted protein - useful as antigen for hookworm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This sequence represents a probe for the precore region of hepatitis by virus (HBV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (1) in the sample, and amplifying the crietavant part of a suitable HBV gene in the sample with at least 1 crietavant part of a suitable HBV gene in the sample with at least 1 crietavant and hybridisal printing (1) with a combination of at least 2 nucleotide probes, which are applied to known locations on a solid or support and hybridise specifically to mutant target sequences chosen from the HBV RP pol gene region, HBV procore region, HBABy region and/or HBV genotype specific target sequences, or their complements or U for T complements (b), and inferring the HBV genotype and/or mutants present in the sample from the differential hybridisation signal (s). The composition can be used to diagnose and/or monitor HBV mutants and/or genotypes in a sample, specifically genotype, precore mutations, vaccine escape mutations and RT generalizations selected by treatment with drugs, e.g. lamivudune and precore core mutations. (c) field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in
               Detection and/or genetic analysis of hepatitis B virus - specifically genotype, precore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs.

                                                                                                                                                                                                                                                 An oligonucleotide is claimed which contains 2-200 residues of natural or synthetic nucleosides which are linked via a nucleotide bridging group. At least 2 of the residues are nucleoside carba analogues (i.e. nucleosides in which the furanose ring is replaced by a cyclopentane ring) having a defined generic formula given in the patent; and at least 2 of these nucleosides are consecutive on at least one occasion. The longonucleotides can be used in antisense therapy for treating infections and diseases, e.g. by blocking the expression of bioactive proteins at the level of nucleic acids (e.g. oncogenes). They can also be used as diseance than that of oligonucleotide which contain natural certainments than that of oligonucleotide which contain natural nucleosides in place of the carba analogues. Furthermore they have increased stability towards degradation by nucleases, and their pairing with complementary RNA is improved. The present sequence is a specific example of an oligonucleotide containing the carba analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Probe; hepatitis b virus; HBV detection; RT pol region; genetic analysis; preCore region; HBsAg region; genotype specific target; mutation detection; ss.

AAV49008-236 represent antisense oligonucleotides directed against the rb gene. Of these, only aligonucleotides AAV49008-52 resulted in effective gene. Of these, only aligonucleotides AAV49063-52 resulted in effective aAV49052-236 had little effect. The oligonucleotides exemplify the invention. The specification describes oligonucleotides that contain 8-30 nucleotides, which contain at most 8 nucleotides that contain 8-30 nucleotides which contain at most 8 nucleotides that contain 8-30 nucleotides bonds to cytosine, do not contain two sequences of three consecutive cytosines; do not contain two sequences of three consecutive nucleotides each able to form the H-bonds each (2R) or three such bonds (2R) is given by 2R/3R = 0.33-0.72. The oligonucleotides are used to modilate expression of genes, particularly the genes for p53, ErB-2, junb, junb, cg. one marrow stem, liver or kidney cells, osteoclasts and/or keratinocytes). The oligonucleotides can also be used to analyse thoration of primain their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for

Preparing antisense oligodeoxynucleotides (ODNs) and long antisense RNA sequences useful for blocking translation of a specific isoform of Tenascin-C protein.

Claim 23; Page 89; 177pp; English.

The present invention describes a method for preparing an antisense oligodeoxymucleotide (ODN) sequence for blocking translation of a specific protein isoform that can be expressed as a number of different isoforms. AAA0512 to AAA05243 represent specifically claimed

```
ö
phosphorothioate antisense ODNs for blocking translation of Tenascin-C using the method of the invention. The method is useful for preparing an obn sequence for blocking translation of a specific isoform of Tenascin-C protein. The method is also useful for blocking translation of a specific family of isoforms of a protein. The method can also be performed by producing a long antisense expression vector encoding a long antisense producing translation of a specific protein isoform. The ODNs and long antisense constructs are useful in designing models for studying cellular development and differentiation. The method permits as a result of alternative splicing. AAAOS244 represent an oligonucleotide from the present invention, which is given in the sequence listing but not mentioned further within the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Novel nucleic acid used for genotyping, e.g. to predict rate of drug metabolism.

Disclosure; Page 13; 46pp; English.

This sequence represents a PCR primer used in the amplification of exons 5 and 6 of human phenol sulphortansferase 2 (STP2). The invention relates from sequences AAZ59305-Z59352 which are fragments of the STP2 gene. The fragments are from the 8 exons, the promoter region, 3' and 5' untranslated regions of the STP2 gene. Each of the sequences contains a newly identified STP2 gene single uncleotide polymorphism (SNP). STP2 is a phenol sulphortansferase. Substrates for STP2 include minoxidit, acetaminophen, and paranitrophenol. Several of the nucleotide changes indentified at the polymorphism sites, give rise to an amino acid change. Amino acid changes can be used as probes for detecting STP2 polymorphisms. The polymorphic probes are used in screening and genotyphing, i.e. to predict the rate of metabolism of STP2 substrates, potential drug-drug interactions and adverse side effects. They can also be used to detect diseases resulting

in the CD36 genes. AAA40606 to AAA40759, and AAB02515 to AAB02564, represent nucleotide and amino acid sequences respectively which are used in the exemplification of the present invention

```
The present invention describes isolated nucleic acid molecules (A) encoding mutant CD36 proteins (B). Parasites such as Plasmodium falciparum (the major cause of malaria) are unable to utilise the mutated proteins to gain entry to, and infect cells. The mutant CD36 proteins do not function correctly preventing parasites utilising them to infect cells. The mutant CD36 proteins do not function correctly preventing parasites utilising them to infect cells. The mutant CD36 proteins according to standard methodologies. They may be used in this way to prevent and treat parasitic infections that utilise the CD36 protein to infect cells, such as P. falciparum, the major cause to from the CD36 protein to infect cells, such as P. falciparum, the major cause of CD36 expression and activity or a patient's CD36 DNA may be screened to determine whether there are any mutations present that may confer resistance to parasitic infections. The proteins and mucleic acids may also be used to prevent, diagnose and treat diseases associated with defects in insulin action and/or glucose metabolism and/or fatty acid metabolism and/or catecholamine action in subjects possessing mutations
                                                                                                                                   ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, rat, CD36; SHR; spontaneous hypertensive rat; diagnosis; therapy; screening; polyymorphism; variant; detection; mutant; blood; mutation; insulin; glucose metabolism; fatty acid metabolism; catecholamine; malaria; infection; parasite; antiparasitic; antidiabetic; primer; ss.

The invention relates to a retroviral vector construct which consists of a 5'-long terminal repeat (5'-LTR); a tRNA binding site; an origin of second strand DNA synthesis; a 3'-LTR and gag/pol sequences modified to contain two or more stop codons. The invention also relates to a gag/pol expression cassette, and an enverpression cassette. The retroviral construct has anticancer, antiviral and immunomodulatory activity. The retroviral constructs are used to produce recombinant retroviral particles for use in gene transfer, particularly gene therapy, e.g. to deliver heterologous sequences that encode cytotoxins, produug activators, replacement genes, antisense sequences or ribozymes, immune accessory molecules and viral immunogens, particularly for treatment or prevention of tumours, viral infections and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New retroviral construct, used to produce retroviral particles for gene therapy, containing a gag/pol sequence that includes at least two stop codons, incapable of producing replicable virus by recombination.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Gag; pol; retroviral vector construct; gag/pol expression cassette; anticancer; antiviral; immunomodulatory; cytotoxin; prodrug activator; replacement gene; antisense sequence; ribozyme; tumour prevention; viral infection; genetic disorder; ss.

The present sequence is provided in a specification relating to a method for determining whether a subject has or is predisposed to develop an interstitial lung disease. The method involves detecting an interleukin-1 receptor antagonist (IL-IRW) (+2018) allele 2, a tumour necrosis alpha (TNF-A) (-308) allele 2, or an allele in linkage disequilibrium with either of these two alleles. The method may be used to determine whether a subject has or is predisposed to develop an interstitial pneumonia or a pulmonary fibrosis and other disorders such as rheumatoid arthritis, systemic objects sythmatchesis, Sjognen's syndrome, systemic sclerosis, dermaromyocitis. The method is also used for identifying molecules which can be used as therapeutics for treating interstitial lung disease

The present invention describes differentially expressed genes involved on angiogenesis (I), and the polypeptides that encode them. (I) have cardiovascular activity, and can be used in the modulation of the interpolypeptides may be used in the prevention, diagnosis and treatment of diseases associated with interpolypeptides may also be used as antigens in the production of antibodies against them and in assays to identify condilators of their expression and activity. The antibodies and activity and attagonists may also be used to down regulate expression and activity and against for detecting the presence of the polypeptides in samples.

Condilators that may be prevented, diagnosed and/or treated by the above methods include, for example vascular tumours, proliferative tumours, proliferative tumours, proliferative uncours, or proliferative vitreoretinopathy, rheumatoid arthritis, Crohn's disease, atherosolerosis, ovarian hyperstimulation, psoriasis, endomerriosis associated with neovascularisation, restenosis subsequent to balloon angioplasty, scar tissue over production. Peripheral vascular disease, thypertension, inflammatory vasculitides, Reynaud's disease and Reynaud's phenomenon, aneurysms, arterial restenosis thrombophlebitis, conditions, heart failure such as condestive heart failure, age-related macular degeneration and osteoprosis. AAH22255 to AAH22255 and AAB98322 conditions, heart sequence used in the exemplification of the present

The protein is a transcriptional control factor, and is a conjugate of retinoblastoma protein (Rb). The present sequence is the an intron-exon junction in the coding sequence of the invention
                                                                                           protein coding sequence exon 25/intron 25 junction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New retinoblastoma protein binding protein, its preparation and application.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequences AAS56729-AAS56968 represent DNA encoding BRCA-1 regulators, and primers used in the methods of the invention. Hybridisation of ribozymes to their targets results in cleavage of the RNA target. The ribozymes to their targets results in cleavage of the RNA target. The ribozymes can be used to cleave regulators of the tumour suppressor BRCA-1, resulting in upregulation or downregulation of BRCA-1 in a cell. The mRNA targets include those encoding the BRCA-1 regulator BR1, inhibitor CHLR2, AF6, BR2 and BR3. Regulation of BRCA-1 is useful for treating and diagnosing cancer and other proliferative disorders. The severity of an incleance of cancer can be lessened by regulating tumour proliferation through modulation of BRCA-1. The sequences of the invention are useful in the development of anti-cancer drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polypeptides that are the regulators of BRCA-1, useful for treating cancer and diagnosing the presence of neoplastic cells in biological
